Assignment 2 - Pandas Introduction

All questions are weighted the same in this assignment.

Part 1

The following code loads the olympics dataset (olympics.csv), which was derived from the Wikipedia entry on [All Time Olympic Games Medals \(https://en.wikipedia.org/wiki/All-time_Olympic_Games_medal_table\)](https://en.wikipedia.org/wiki/All-time_Olympic_Games_medal_table), and does some basic data cleaning.

The columns are organized as # of Summer games, Summer medals, # of Winter games, Winter medals, total # number of games, total # of medals. Use this dataset to answer the questions below.

```

In [5]: import pandas as pd

df = pd.read_csv('olympics.csv', index_col=0, skiprows=1)

for col in df.columns:
    if col[:2]=='01':
        df.rename(columns={col:'Gold'+col[4:]}, inplace=True)
    if col[:2]=='02':
        df.rename(columns={col:'Silver'+col[4:]}, inplace=True)
    if col[:2]=='03':
        df.rename(columns={col:'Bronze'+col[4:]}, inplace=True)
    if col[:1]=='№':
        df.rename(columns={col:'#'+col[1:]}, inplace=True)

names_ids = df.index.str.split('\s\(') # split the index by '('

df.index = names_ids.str[0] # the [0] element is the country name (new index)
df['ID'] = names_ids.str[1].str[:3] # the [1] element is the abbreviation or ID (

df = df.drop('Totals')
df.head()

```

Out[5]:

	# Summer	Gold	Silver	Bronze	Total	# Winter	Gold.1	Silver.1	Bronze.1	Total.
Afghanistan	13	0	0	2	2	0	0	0	0	0
Algeria	12	5	2	8	15	3	0	0	0	0
Argentina	23	18	24	28	70	18	0	0	0	0
Armenia	5	1	2	9	12	6	0	0	0	0
Australasia	2	3	4	5	12	0	0	0	0	0

Question 0 (Example)

What is the first country in df?

This function should return a Series.

```
In [6]: # You should write your whole answer within the function provided. The autograder
# this function and compare the return value against the correct solution value
def answer_zero():
    # This function returns the row for Afghanistan, which is a Series object. Th
    # question description will tell you the general format the autograder is exp
    return df.iloc[0]

# You can examine what your function returns by calling it in the cell. If you ha
# about the assignment formats, check out the discussion forums for any FAQs
answer_zero()
```

```
Out[6]: # Summer      13
Gold      0
Silver    0
Bronze    2
Total     2
# Winter    0
Gold.1    0
Silver.1  0
Bronze.1  0
Total.1   0
# Games    13
Gold.2    0
Silver.2  0
Bronze.2  2
Combined total  2
ID          AFG
Name: Afghanistan, dtype: object
```

Question 1

Which country has won the most gold medals in summer games?

This function should return a single string value.

```
In [143]: import numpy as np
def answer_one():
    my_list = df.sort("Gold")[-1::]
    return my_list.index.values[0]

answer_one()
```

```
Out[143]: 'United States'
```

Question 2

Which country had the biggest difference between their summer and winter gold medal counts?

This function should return a single string value.

```
In [230]: import numpy as np
def answer_two():
    my_list = df.copy()
    my_list['Diff'] = abs(my_list["Gold"] - my_list["Gold.1"])
    my_list = my_list.sort('Diff')[-1::]
    return my_list.index.values[0]

answer_two()
```

Out[230]: 'United States'

Question 3

Which country has the biggest difference between their summer gold medal counts and winter gold medal counts relative to their total gold medal count?

$$\frac{\text{Summer Gold} - \text{Winter Gold}}{\text{Total Gold}}$$

Only include countries that have won at least 1 gold in both summer and winter.

This function should return a single string value.

```
In [233]: def answer_three():
    my_list = df[(df['Gold']>0) & (df['Gold.1']>0)]
    my_list['Diff'] = abs(my_list['Gold']-my_list['Gold.1']) / (my_list['Gold']+my_list['Gold.1'])
    return my_list.sort('Diff')[-1::].index.values[0]

answer_three()
```

Out[233]: 'Bulgaria'

Question 4

Write a function that creates a Series called "Points" which is a weighted value where each gold medal (Gold.2) counts for 3 points, silver medals (Silver.2) for 2 points, and bronze medals (Bronze.2) for 1 point. The function should return only the column (a Series object) which you created.

This function should return a Series named Points of length 146

```
In [193]: def answer_four():
          Points = df.copy()
          Points['Points'] = (Points['Gold']+Points['Gold.1']+Points['Gold.2'])*3 + (Po
          return Points['Points']
          answer_four()
```

```
Out[193]: Afghanistan      4
          Algeria          54
          Argentina        260
          Armenia          32
          Australasia       44
          Australia        1846
          Austria          1138
          Azerbaijan        86
          Bahamas          48
          Bahrain           2
          Barbados          2
          Belarus          308
          Belgium          552
          Bermuda           2
          Bohemia           10
          Botswana          4
          Brazil           368
          British West Indies 4
          Bulgaria          822
          Burundi           6
          Cameroon          24
          Canada           1692
          Chile             48
          China             2240
          Colombia          58
          Costa Rica        14
          Ivory Coast        4
          Croatia           134
          Cuba              840
          Cyprus            4
          ...
          Spain            536
          Sri Lanka         8
          Sudan             4
          Suriname          8
          Sweden            2434
          Switzerland       1260
          Syria             12
          Chinese Taipei     64
          Tajikistan         8
          Tanzania           8
          Thailand           88
          Togo               2
          Tonga              4
          Trinidad and Tobago 54
          Tunisia            38
          Turkey             382
          Uganda            28
          Ukraine            440
          United Arab Emirates 6
```

United States	11368

Venezuela	36
Vietnam	8
Virgin Islands	4
Yugoslavia	342
Independent Olympic Participants	8
Zambia	6
Zimbabwe	36
Mixed team	76

Name: Points, dtype: int64

Part 2

For the next set of questions, we will be using census data from the [United States Census Bureau \(http://www.census.gov/popest/data/counties/totals/2015/CO-EST2015-alldata.html\)](http://www.census.gov/popest/data/counties/totals/2015/CO-EST2015-alldata.html). Counties are political and geographic subdivisions of states in the United States. This dataset contains population data for counties and states in the US from 2010 to 2015. [See this document \(http://www.census.gov/popest/data/counties/totals/2015/files/CO-EST2015-alldata.pdf\)](http://www.census.gov/popest/data/counties/totals/2015/files/CO-EST2015-alldata.pdf) for a description of the variable names.

The census dataset (census.csv) should be loaded as census_df. Answer questions using this as appropriate.

Question 5

Which state has the most counties in it? (hint: consider the sumlevel key carefully! You'll need this for future questions too...)

This function should return a single string value.

```
In [194]: census_df = pd.read_csv('census.csv')
census_df.head()
```

```
Out[194]:
```

	SUMLEV	REGION	DIVISION	STATE	COUNTY	STNAME	CTYNAME	CENSUS2010POP
0	40	3	6	1	0	Alabama	Alabama	4779736
1	50	3	6	1	1	Alabama	Autauga County	54571
2	50	3	6	1	3	Alabama	Baldwin County	182265
3	50	3	6	1	5	Alabama	Barbour County	27457
4	50	3	6	1	7	Alabama	Bibb County	22915

5 rows × 100 columns

```
In [234]: def answer_five():
            my_list = census_df[census_df['SUMLEV'] == 50]
            result = my_list.groupby('STNAME').count()['SUMLEV']
            return result.idxmax()

            answer_five()
```

Out[234]: 'Texas'

Question 6

Only looking at the three most populous counties for each state, what are the three most populous states (in order of highest population to lowest population)? Use CENSUS2010POP.

This function should return a list of string values.

```
In [258]: def answer_six():
            my_list = census_df[census_df['SUMLEV'] == 50]
            result = my_list.sort_values(['STNAME', 'CENSUS2010POP'], ascending=False)
            result = result.groupby('STNAME').head(3)
            result = result.groupby('STNAME').sum().sort('CENSUS2010POP', ascending=False)
            return result

            answer_six()
```

Out[258]: ['California', 'Texas', 'Illinois']

Question 7

Which county has had the largest absolute change in population within the period 2010-2015?
(Hint: population values are stored in columns POPESTIMATE2010 through POPESTIMATE2015, you need to consider all six columns.)

e.g. If County Population in the 5 year period is 100, 120, 80, 105, 100, 130, then its largest change in the period would be $|130-80| = 50$.

This function should return a single string value.

```
In [227]: def answer_seven():
            counties_df = census_df[census_df['SUMLEV'] == 50]
            counties_df['pop_change'] = abs(counties_df['POPESTIMATE2015'] - counties_df[
a = max(counties_df['pop_change'])
            ans = counties_df['CTYNAME'][counties_df['pop_change']==a].tolist()
            return ans[0]

            answer_seven()
```

Out[227]: 'Harris County'

Question 8

In this datafile, the United States is broken up into four regions using the "REGION" column.

Create a query that finds the counties that belong to regions 1 or 2, whose name starts with 'Washington', and whose POPESTIMATE2015 was greater than their POPESTIMATE 2014.

This function should return a 5x2 DataFrame with the columns = ['STNAME', 'CTYNAME'] and the same index ID as the census_df (sorted ascending by index).

```
In [228]: def answer_eight():
            counties_df = census_df[census_df['SUMLEV'] == 50]
            ans = counties_df[((counties_df['REGION']==1)|(counties_df['REGION']==2))&(co
            return ans

            answer_eight()
```

Out[228]:

	STNAME	CTYNAME
896	Iowa	Washington County
1419	Minnesota	Washington County
2345	Pennsylvania	Washington County
2355	Rhode Island	Washington County
3163	Wisconsin	Washington County
